

v9.3 — what I applied, and on whose authority

Read the inference list. That is where an adversarial read pays.

A. Your rulings, applied as stated

Ruling	Where
The variables describe the implicit register — the structural requirement of logic; the explicit register is what physics, biology and the rest explain	new structural §0; header of every chain; new DDJ register section
可/常 is that distinction; the received opening declares it and nothing else — “here’s how the logic works even if you don’t apply it to anything real”	DDJ, new opening section
The involution: mode-swap structural, sign-flip explicit — no negative, only conjugate	structural §3, §8; math throughout; physics §4; DDJ 可 entry
First distinction: at least one, $> 0 $	structural §2
Generation has no parametric address	structural §6; math engine; DDJ ch. 42
Cross-frame share = pattern and reference; the parent’s inexactness is the child’s origin	structural §7; DDJ 法 cascade
“The joint” is P_n — a paradox, not a place	struck from all four; “the reciprocity joint” renamed the reciprocity <i>requirement</i>
B_n is the whole line $X_n = Y_n$, reaching from O_n through the paradoxical center of G_n ; P_n is the crossing	structural §5; math notation
Two modes equalling each other is not the frame that holds them in proportion — no point of B obtains	structural §1, §5
Where up=down no height, before=after no time, void=form no reality	structural §1
	replaced by: at frame n’s

"Met at resolution" is not yours — struck	resolution the two amounts are not distinguishable
$B_n \rightarrow y\text{Axis}_{(n+1)}$	structural §7; math parturition entry
Rotation: G_n revolving about B_n gives the recursion	structural §6; math, new Revolution theorem
A branch is not a smaller part of a trunk; same logic, different parameters	physics §8, rewritten
No replacement protocol; refusals set aside	throughout

B. My inferences — audit these

1. **"Seat" struck alongside "joint."** Same class of surplus noun; you ruled the first, not the second. Reversible.
2. **The disconnection theorem.** From B not obtaining, I concluded the X-dominant and Y-dominant regions have no in-frame path. Stated as following, in the math chain. This replaces old T1 without a signed chart — the largest single recovery in the set, and the line to attack first.
3. **Revolution as forced.** That the relation between the two regions *must* be carried by revolution, rather than merely can be. You said rotation gives the recursion; I gave it a necessity argument.
4. **Dimension via revolution.** Item 3 now cites revolution-needs-a-direction as its route. Previously two unadjudicated candidates; I did not adjudicate them, I added a third consideration.
5. **The ring as consequence rather than postulate.** §7 previously asserted the ring; I derived it from rotational freedom about the inherited axis.
6. **P_0/P_n differentiator rewritten.** The old one used "occupiable at resolution." Mine: what survives the collapse — at P_n the frame obtains elsewhere, at P_0 there is no elsewhere.
7. **The whole tag apparatus removed,** along with the physics entry tags, the break-condition entrance rule, the banned sentence class, the evidential posture, the forbidden flows, and both invented tests. Kept: $::$, the strike list as a list, the register distinction, and plain prose for what is unsettled.
8. **The two senses of smaller** (fineness / descent), and the withdrawal of the $|0|$ -to-divisibility mapping. Flagged before, never ruled.

9. **The scope-note hypothesis** in the DDJ register section — that ch. 1 was prepended against a misreading already underway. Marked as a candidate in the text.
10. ~~The etymology guard~~ — removed; it banned the project's own method.
11. **Bekenstein rewritten as a category fact** plus a named limit on reach. The limit — no contact with holography in either direction — is mine, not yours.

C. Not done

- Ch. 40 Mawangdui facsimiles: blocking the *dating* only. Your errand.
- Branching beyond P_n : candidate stated, unruléd.
- Dimension three: unadjudicated.
- Definition T: flagged as needing restatement in the mode-expressible domain, where the disconnection now lives. Not attempted.

v9.3 — review pass

Applied from the .90 review, as accepted: strike the *nearest* sentence in §5 (measure content); ground the dimension requirement in orientation rather than assertion (§6); retire the numeral faces for the **empty face** and **full face**, propagated to the math chain; "It cascades" → "The typing extends"; "The 法 cascade" → "The 法 regress"; the two ch. 42 tokens.

Item 1, applied in a different form than proposed. The review would have had §2 read "reality obtains (P1)." P1 is the Conditional and asserts no existence — the physics chain depends on that, since a conditional is not refuted by its antecedent failing. But the gap the review found is real: P_0 's impossibility alone does not exclude sheer nothing. The step now runs through P2 twice: the collapse is excluded, and indistinction on its own is excluded as one side of the pair that is not distinguishable. Same conclusion, no new premise, and §2 now says explicitly that P1 is doing no work here.

Still open for you, not applied.

- **Anchoring's double status** (math). The body's typing argument and open item 1 both claim it. Delete it from the open items, or mark the body sentence a candidate closure — one or the other, not both. Adopting a deletion on my judgment would be a delegated closure.
- ~~The etymology guard against 始/母~~. **Resolved by removing the guard**, which was mine

and should not have been written: radical-level analysis is the project's primary instrument, and a rule against reading structure off graphs bans the method. The 萬 case was narrower than the rule made it — there the graph belongs to a different word than the number. The 始/母 entry stands as written; note separately that 母 is a modified 女 graph rather than 女-plus-determinative, which is a philological point about the clause's wording, not about whether graphic argument is allowed.

- **The three-forms 生 taxonomy** (DDJ). The 非 shared-invariant reading and the 玄/牝/玄牝 triple are on record as your rulings. The three-forms taxonomy is not; its provenance is unresolved.

Not applied, by the standard set this session. The review's preamble clause for the physics chain — a note preempting the objection that §1 and §2 render 1_n differently — answers an objection nobody has raised, which is the move struck along with the evidential posture. And its proposal to tag unresolved entries [unaudited] has nowhere to land: the tag system came out this afternoon.

Folder pass — the .90-era project

Searched for recoverable material. Finding: this folder is mostly the layer v9 superseded — the six-axiom architecture, Euler-as-structural-axiom, the per-constant mappings the Substack series taught. Nearly all of its surviving content is already in v9.3 in stronger form (the sphere route, the origin-manifold reading of the ring, the Archimedean material).

One genuine recovery, applied: the spin debt's second candidate account was already in the monograph — spinorial phenomena (sign at 2π , return at 4π) as "a natural feature of orientational democracy." Strengthened in transit: the double-connectedness of orientation-preserving frames in three dimensions survives without a metric, so the account is register-clean once dimension lands at three. Added to the physics chain's spin entry beside the parturition candidate, with the note that the two rhyme ($w = z^2$ is itself the model double cover).

Not recoverable, and why: the Schrödinger-from-chapter-40 derivation (a character entering a derivation — the one DDJ discipline retained); $E \propto 1/r$ as law rather than instance-content; the rational- π "error conditions" (π 's value is not contingent, so these are not predictions); the six-axiom framing throughout.
